

THE LEAP

THE LEAP INTO MÙ CANG CHÀI

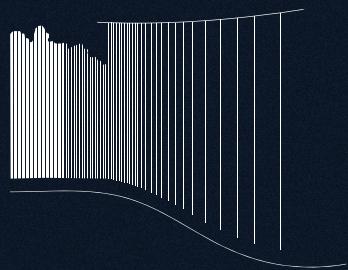

The wind of Mù Cang Chài The building places itself across the edge of the forest and the open landscape, creating a bridge between the element of earth and air.

As you go on the path to the building through the forest

The valleys of Mù Cang Chài..

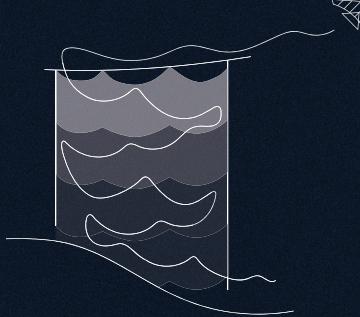

TRANSITION

The bamboo structure works as a tool to generate a smooth transition from the dense forest to the open terraced fields. In this way, the structure works as an extension of the existing landscape, transitioning into the element of air.

MOVEMENT

Like a hang glider, the visitor sails through the structure from suspension bridges and platforms. As you move upwards, the structure slowly dissolves and the soothing wind becomes more and more present.

CONSTRUCTION

Bamboo as a construction material has a high strength-to-weight ratio which enables to build slender constructions that get almost transparent qualities. The light weight ease the transportation to the hilly Mù Cang Chài area.
